✅ **Install**

3. Navigate to your domain (http://www.domain.com)
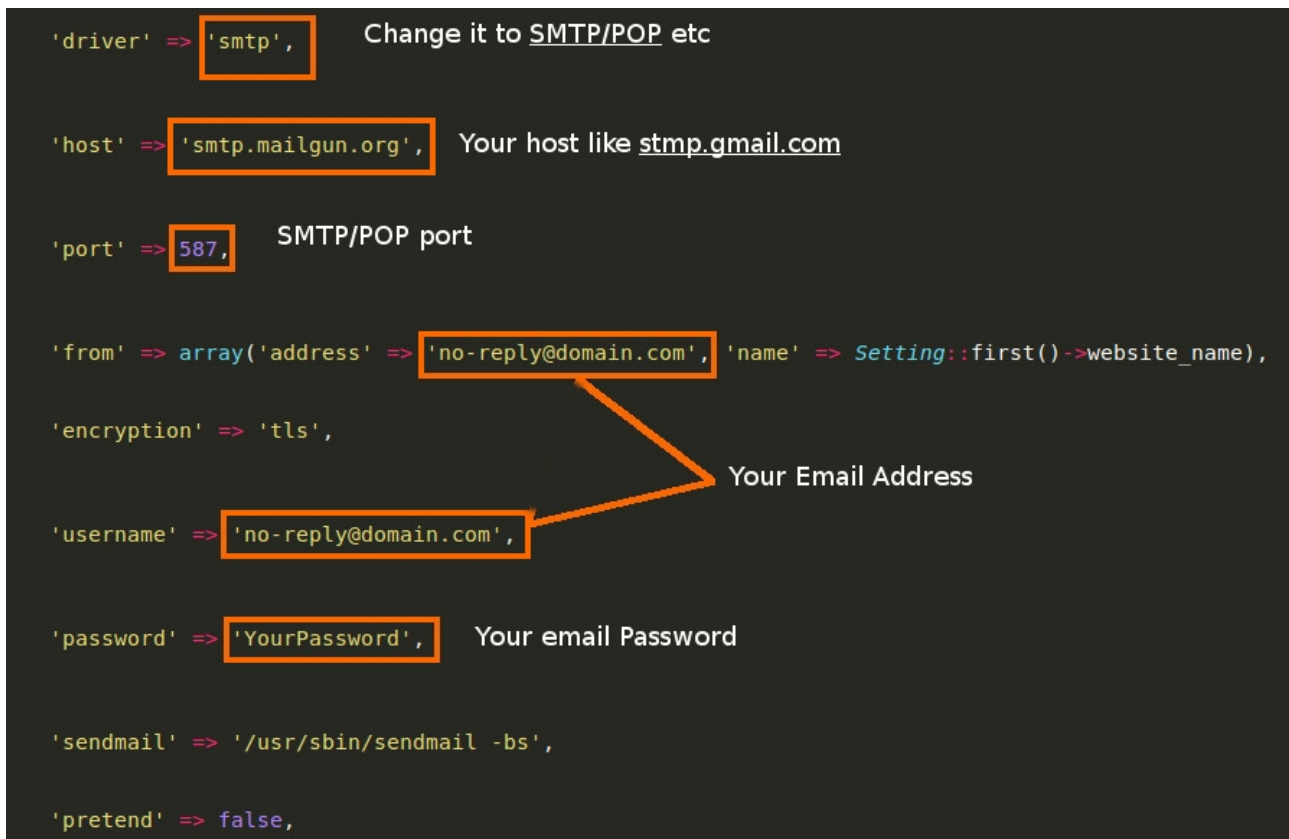

Mail Settings: Important! Configure your SMTP settings otherwise registration of users wont work.
Open **app/config/mail.php** file and edit your SMTP details. you can see your SMTP details on your hosting provider control panel.

You've to setup an email Account on your hosting account or use your Gmail/Live account. Change these fields of **app/config/mail.php** file.

```
'driver' => 'smtp',          Change it to SMTP/POP etc

'host' => 'smtp.mailgun.org',   Your host like stmp.gmail.com

'port' => 587,          SMTP/POP port

'from' => array('address' => 'no-reply@domain.com', 'name' => Setting::first()->website_name),

'encryption' => 'tls',
                                        Your Email Address
'username' => 'no-reply@domain.com',

'password' => 'YourPassword',    Your email Password

'sendmail' => '/usr/sbin/sendmail -bs',

'pretend' => false,
```

Admin Dashboard: After Setting up the script, you may login with admin username and password to manage the site.

<u>Language Change / Translation:</u>

To change the language or translate the script all you need to do is open the /**app**/**lang**/**eng**/**words.php** file and change the right hand side texts. For example.

'search'   =>   '**Search**',

                                      To

'search'   =>   'поиск', (Change this to your language)

<u>Thanks for Buying the Script.</u>
